Computing now-a-days

- Internet Technology
 - Internet 2.0, Broadband access, exploding usage...
- Mobile "Telephony" Technology
 - 3G, iMode, WAP, Wireless PDAs, Bluetooth...
- Software Technology
 - JavaBeans, Soap, UDDI, JINI...
- Web Technology
 - XML, RDF, Servlets, JavaBeans, "Semantic Web"
- A
 - Reasoning, Knowledge Representation, Agents...

jvazquez@lsi.upc.edu

3

Origins of MAS

- Five ongoing trends have marked the history of computing [M. Wooldridge]:
 - ubiquity;
 - interconnection;
 - intelligence;
 - delegation; and
 - human-orientation

troduc

jvazquez@lsi.upc.edu

5 trends (1 of 3)

Ubiquity

- The continual reduction in cost of computing capability has made it possible to introduce processing power into places and devices that would have once been uneconomic
- As processing capability spreads, computation (and intelligence of a sort) becomes ubiquitous

Interconnection

- Computer systems today no longer stand alone, but are networked into large distributed systems
- Since distributed and concurrent systems have become the norm, some researchers are putting forward theoretical models that portray computing as primarily a process of interaction

jvazquez@lsi.upc.edu

5

5 trends (2 of 3)

Intelligence

 The complexity of tasks that we are capable of automating and delegating to computers has grown steadily, to the limits that we can define as intelligent.

Delegation

- Computers are doing more for us without our intervention
- We are giving control to computers, even in safety critical tasks

Human orientation

- The movement away from machine-oriented views of programming toward concepts and metaphors that more closely reflect the way we ourselves understand the world
- Programmers conceptualize and implement software in terms of higher-level – more human-oriented – abstractions

jvazquez@lsi.upc.edu

1.Introduction

5 trends (3 of 3)

- Delegation and Intelligence imply the need to build computer systems that can act effectively on our behalf
- This implies:
 - The ability of computer systems to act independently
 - The ability of computer systems to act in a way that represents our best interests while interacting with other humans or systems
- Interconnection and Distribution have become core motifs in Computer Science
- But Interconnection and Distribution, coupled with the need for systems to represent our best interests, implies:
 - Systems that can cooperate and reach agreements (or even compete) with other systems that have different interests (much as we do with other people)

jvazquez@lsi.upc.edu

7

Computer Science progression

- These issues were not studied in Computer Science until recently
- All of these trends have led to the emergence of a new field in Computer Science: multiagent systems
- Wooldridge says that programming has progressed through:
 - machine code;
 - assembly language;
 - machine-independent programming languages;
 - sub-routines;
 - procedures & functions;
 - abstract data types;
 - objects;

to agents.

1.Introduction

Agents and Multiagent Systems

- An agent is a computer system that is capable of independent action on behalf of its user or owner (figuring out what needs to be done to satisfy design objectives, rather than constantly being told)
- A multiagent system is one that consists of a number of agents, which *interact* with one-another
- In the most general case, agents will be acting on behalf of users with different goals and motivations
- To successfully interact, they will require the ability to cooperate, coordinate, and negotiate with each other, much as people do

jvazquez@lsi.upc.edu

9

Agents and Multiagent Systems

- Building Agents, we address questions such as:
 - How do you state your preferences to your agent?
 - How can your agent compare different deals from different vendors? What if there are many different parameters?
 - What algorithms can your agent use to negotiate with other agents (to make sure you get a good deal)?
- In Multiagent Systems, we address questions such as:
 - How can cooperation emerge in societies of self-interested agents?
 - What kinds of languages can agents use to communicate?
 - How can self-interested agents recognize conflict, and how can they (nevertheless) reach agreement?
 - How can autonomous agents coordinate their activities so as to cooperatively achieve goals?

Agent Design, Society Design

- Two key problems:
 - How do we build agents capable of independent, autonomous action, so that they can successfully carry out tasks we delegate to them?
 - How do we build agents that are capable of interacting (cooperating, coordinating, negotiating) with other agents in order to successfully carry out those delegated tasks, especially when the other agents cannot be assumed to share the same interests/goals?
 - The first problem is *agent design* [in this course we cover this in 2. Reasoning in Agents].
 - The second is society design (micro/macro) [in this course we cover this in 3. Agent-Oriented Methodologies & 4. Coordination and Social Models].

jvazquez@lsi.upc.edu

11

Multiagent Systems is Interdisciplinary

- The field of Multiagent Systems is influenced and inspired by many other fields:
 - Philosophy
 - Logic
 - Game Theory
 - Economics
 - Social Sciences
 - Ecology
- This can be both a strength (infusing well-founded methodologies into the field) and a weakness (there are many different views as to what the field is about)

1.Introductio

2 Views of the Field

- Agents as a paradigm for software engineering:
 Software engineers have derived a progressively better understanding of the characteristics of complexity in software. It is now widely recognized that interaction is probably the most important single characteristic of complex software
- Over the last two decades, a major Computer Science research topic has been the development of tools and techniques to model, understand, and implement systems in which interaction is the norm

jvazquez@lsi.upc.edu

13

2 Views of the Field

- Agents as a tool for understanding human societies:
 Multiagent systems provide a novel new tool for
 simulating societies, which may help shed some light
 on various kinds of social processes.
- This has analogies with the interest in "theories of the mind" explored by some artificial intelligence researchers

.Introduction

I.Introduction

Standards: FIPA (www.fipa.org)

- International Agent Standard
 - Started in 1996 to provide agent technology specifications.
 - Part of IEEE (since 2005) as 11th standards committee.
- Includes standards for
 - Communication: Agent Communication Languages, Content Languages, Semantic Framework
 - Infrstructure: directories, message transport, naming, etc...
- Recent trends
 - Moved toward web technology (XML, RDF, HTTP)
 - Plug and Play architectures
 - Moves for Java standard
- Next phase
 - Verification
 - Significant take-up
 - Demonstration of Value

jvazquez@lsi.upc.edu

Hot topic: Open Service Environments

- Explosion of Agent technology with new uses for Open Service Environments
- Automation of Services
 - Proactive, responsible, intelligent, peer to peer
- Dynamic Composition of Services
 - Automated discovery, automated coordination,
 "Just in Time" Enterprises, Virtual Companies
- Semantics
 - HTML won't do anymore
 - "Semantic Web"
 - Service-level semantics
 - Semantics for E-commerce
 - Service-Oriented Architectures' frameworks

Agent types and architectures

- Agent properties
- Environment properties
- Agent types
- Abstract architecture

Agent Properties Autonomy

- An agent is a computer system capable of autonomous action in some environment in order to meet its design objectives
- Usually the environment is complex and dynamic, and agents should interact with it in real time.
- sensors

o Main property: Autonomous

capable of acting independently, exhibiting control over their internal state

jvazquez@lsi.upc.edu

18

Introductio

Agent Properties

Autonomy, Flexibility

- Trivial (non-interesting) agents:
 - thermostat
- Def. 2: An intelligent agent is a computer system capable of flexible autonomous action in some environment
- By flexible, we mean:
 - reactive (response capability)
 - pro-active (taking initiative)
 - social (interacting with others)

jvazquez@lsi.upc.edu

19

Agent Properties

Reactivity

- If a program's environment is guaranteed to be fixed, the program need never worry about its own success or failure – program just executes blindly
 - Example of fixed environment: compiler
- The real world is not like that: things change, information is incomplete. Many (most?) interesting environments are dynamic
- Software is hard to build for dynamic domains: program must take into account possibility of failure – ask itself whether it is worth executing!
- A reactive system is one that maintains an ongoing interaction with its environment, and responds to changes that occur in it (in time for the response to be useful)

.Introductio

Agent Properties

Proactiveness

- Reacting to an environment is easy (e.g., stimulus → response rules)
- But we generally want agents to do things for us
- Hence goal directed behavior
- Pro-activeness = generating and attempting to achieve goals; not driven solely by events; taking the initiative
- Recognizing opportunities

jvazquez@lsi.upc.edu

21

Agent Properties

Social Ability

- The real world is a multi-agent environment: we cannot go around attempting to achieve goals without taking others into account
- Some goals can only be achieved with the cooperation of others
- Similarly for many computer environments: witness the Internet
- Social ability in agents is the ability to interact with other agents (and possibly humans) via some kind of agent-communication language, and perhaps cooperate with others

Introduction

Agent Properties

Balancing Reactive and Goal-Oriented Behavior

- We want our agents to be reactive, responding to changing conditions in an appropriate (timely) fashion
- We want our agents to systematically work towards long-term goals
- These two considerations can be at odds with one another

Reactivy vs. Deliberation balance

 Designing an agent that can balance reactivity and deliberation (reason about long term goals) remains an open research problem

jvazquez@lsi.upc.edu

23

Other Agent Properties

(desireable, not mandatory)

- mobility
 - the ability of an agent to move around an electronic network
- veracity
 - an agent will not knowingly communicate false information
- benevolence
 - agents do not have conflicting goals, and that every agent will therefore always try to do what is asked of it
- rationality
 - agent will act in order to achieve its goals, and will not act in such a way as to prevent its goals being achieved — at least insofar as its beliefs permit
- learning/adaption
 - agents improve performance over time

Environment properties

Accessible vs. inaccessible

- An accessible environment is one in which the agent can obtain complete, accurate, up-to-date information about the environment's state
- Most moderately complex environments (including, for example, the everyday physical world and the Internet) are inaccessible
- The more accessible an environment is, the simpler it is to build agents to operate in it

jvazquez@lsi.upc.edu

25

Environment properties

Deterministic vs. non-deterministic

- A deterministic environment is one in which any action has a single guaranteed effect — there is no uncertainty about the state that will result from performing an action
- The physical world can to all intents and purposes be regarded as non-deterministic
- Non-deterministic environments present greater problems for the agent designer

.Introduction

Environment properties

Episodic vs. non-episodic

- In an episodic environment, the performance of an agent is dependent on a number of discrete episodes, with no link between the performance of an agent in different scenarios
- Episodic environments are simpler from the agent developer's perspective because the agent can decide what action to perform based only on the current episode

 it need not reason about the interactions between this and future episodes

jvazquez@lsi.upc.edu

27

Environment properties

Static vs. dynamic

- A static environment is one that can be assumed to remain unchanged except by the performance of actions by the agent
- A dynamic environment is one that has other processes operating on it, and which hence changes in ways beyond the agent's control
- Other processes can interfere with the agent's actions (as in concurrent systems theory)
- The physical world is a highly dynamic environment

Introduction

Environment properties

Discrete vs. continuous

- An environment is discrete if there are a fixed, finite number of actions and percepts in it
- Russell and Norvig give a chess game as an example of a discrete environment, and taxi driving as an example of a continuous one
- Continuous environments have a certain level of mismatch with computer systems
- Discrete environments could in principle be handled by a kind of "lookup table"

jvazquez@lsi.upc.edu

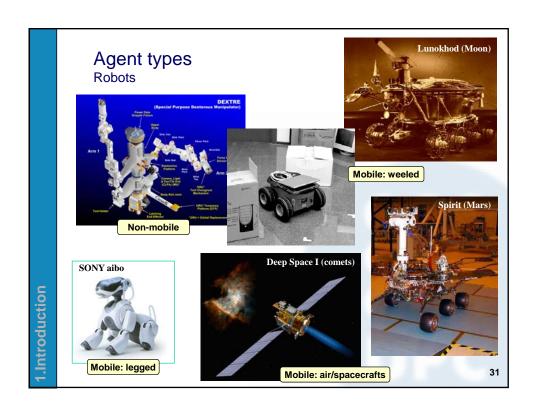

29

Agent types

Physical (embodied) Agents vs. Software Agents

- Software agents' environment is a virtual one
 - Single machine, intranet, internet
 - Interact with other software agents, with sw modules, services
 - Interact with humans through human interfaces
- Physical agents or embodied agents
 - Interact with real world (sensors, actuators connected to real world)
 - Problems of perception and action
 - Best known example: Robots.

jvazquez@lsi.upc.edu

roduction

Agent Types Software agents

- Internet agents (search and information extraction/management from Internet)
- Collaborative agents (they coordinate with other agents to solve a common task)
 - To solve problems too complex for a single agent
 - To solve problemes distributed in nature
 - To interconnect already existing, heterogeneous systems
 (→ Agentification)
- Interface agents (they collaborate with a human user to solve a task, or to act on behalf of the user.
- Mobile SW agents (they can move from one computer to another)

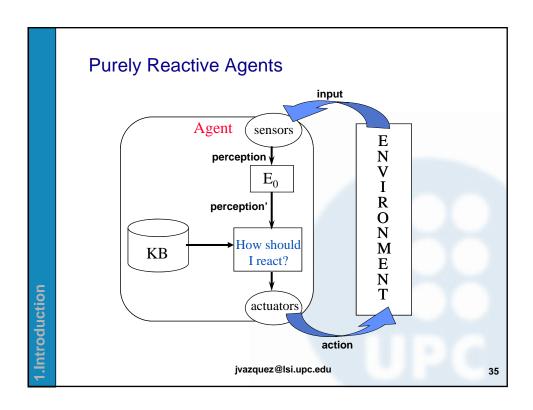

jvazquez@lsi.upc.edu

33

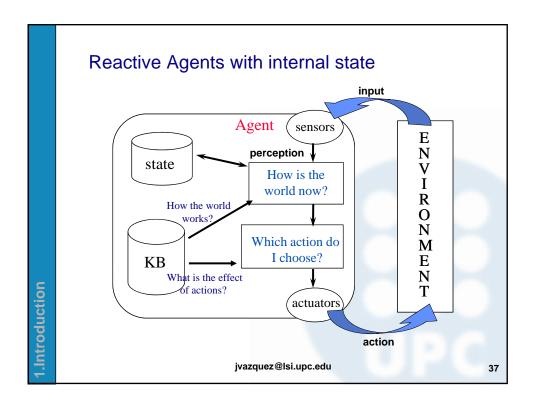

Agent types

Internal architecture

- Purely Reactive Agents (with no internal state)
- Reactive Agents with internal state
- Delliberative Agents (goal-oriented behaviour)
- Hybrid Agents (combine reactive and delliberative behaviour)

Furely Reactive Agents function pra(percept) returns (action) static rules state — interpret-input(percept) rule — rule-match(state,rules) action — rule-action[rule] return action

Reactive Agents with internal state

```
Function reactive-agent-with-state(percept) returns action
Static
          state; a world description
          rules ;a set of, e.g., if-then rules
```

action ← rule-action[rule]

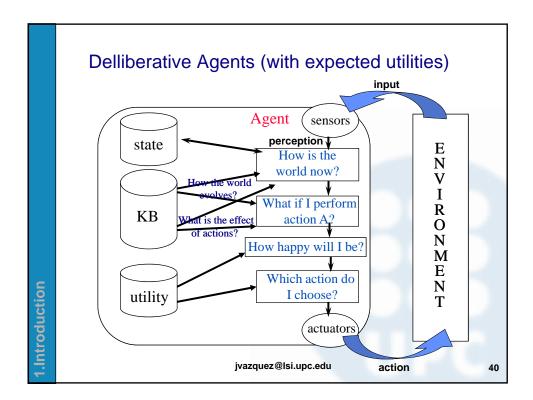

return ← action

Tasks for Agents

- We build agents in order to carry out tasks for us
- The task must be specified by us...
- But we want to tell agents what to do without telling them how to do it
- One possibility: associate utilities with individual states — the task of the agent is then to bring about states that maximize utility

jvazquez@lsi.upc.edu

39

ntroductio

Utility Functions over States

• A task specification is a function

 $u: E \rightarrow \#$

which associates a real number with every environment state

- But what is the value of a run...
 - minimum utility of state on run?
 - maximum utility of state on run?
 - sum of utilities of states on run?
 - average?
- Disadvantage: difficult to specify a long term view when assigning utilities to individual states (One possibility: a discount for states later on.)

jvazquez@lsi.upc.edu

41

Utilities over Runs

 Another possibility: assigns a utility not to individual states, but to runs themselves:

$$u: R \to \#$$

- Such an approach takes an inherently long term view
- Other variations: incorporate probabilities of different states emerging
- Difficulties with utility-based approaches:
 - where do the numbers come from?
 - we don't think in terms of utilities!
 - hard to formulate tasks in these terms

.Introduction

jvazquez@lsi.upc.edu

Delliberative Agents (with explicit goals) Function reactive-agent-with-goals(percept) returns action Static state; a world description rules; a set of, e.g., if-then rules goals; a list of goal states state ← update-state(state,percept) appliable-rules ← rule-match(state,rules) possible-actions ← rule-action[rule] action ← goal-oriented-selection[possible-actions] state ← update-state(state,action) return action [We will see this in 2. Reasoning in Agents] ivazquez@lsi.upc.edu 44

Multiagent Systems' architecture

- Agents in a multiagent system tend to interact through a middleware layer
- This middleware provides connectivity between agents, solving low-level connectivity issues
 - Communication methods
- Sometimes this middleware is called agent platform

jvazquez@lsi.upc.edu

45

Social Ability

Why agent communication?

- In order to solve distributed problems, agents need to coordinate (cooperate, compete) with others.
- For this Agents need to communicate
- Goals for Agent Communication:
 - Agents able to request (to other ags.) actions or services that they cannot perform by themselves
 - Agents able to ask for information (to other ags.)
 - Agents able to share their beliefs with other ags.
 - Agents able to coordinate with other ags. To solve complex tasks.

1.Introduction

Communication methods

- Blackboard systems
 - Agents communicate information through a common data structure, accessible by everybody
 - Problem: if there is no middleware to provide some concurrency, it tends to become a bottleneck.
- Message passing
 - Agents communicate directly by means of messages
 - The agent platform usually acts as message router
 - Common communication language (e.g. FIPA-ACL)
 - Common communication protocols (message format, steps in a communication)

jvazquez@lsi.upc.edu

47

Levels in Agent Communication

- Four levels in communication:
 - Message Semantics
 - · What does each message means?
 - 3 components
 - Message type (performative): gives intensionality
 - Message content: contains the information
 - Ontology (the message refers to)
 - Message Sintaxis
 - How each message is expressed?
 - 2 components
 - Message structure: Agent Communication Language
 - Content codification: Content Language
 - Interaction protocol
 - How are conversations/dialogues structured?
 - Agent Protocols
 - Transport protocol
 - How messages are actually sent and received by agents?

jvazquez@lsi.upc.edu
