4. Coordination and Social Models

Part 4: Coordination models (I):
Social Models

Electronic Institutions

Javier Vázquez-Salceda
MASD

Introduction to Electronic Institutions

• Institutions as Social Structures
• e-Institutions
• Approaches in Literature
Introduction

- Open multi-agent systems (MAS) have to cope with several issues
  - Heterogeneity among members
  - Communication
  - Participants' trust

  • Coordination
  • Cooperation

- Agent Autonomy VS Control

- Idea: multi-agent design can benefit from social abstractions
  - Study the problem from the societal and the individual points of view.

4. Coordination and Social Models

Introduction

Institutions as Social Structures

- Social Structures define a social level to enhance coordination by means of interaction patterns

- Institutions are a kind of social structure where a corpora of constraints shape the behaviour of the members of a group

- The definition of a (human) Institution uses to include
  - Regulations about the interactions
  - Conventions: ‘institutional facts’ vs ‘brute facts’
    - e.g. 1: ‘murder’ (vs killing)
    - e.g. 2: ‘incest’ (vs sexual act)
    - e.g. 3: ‘ownership’ (vs physical possession)
    - e.g. 4: ‘marriage’ (vs living together)

- Procedures and protocols for creating and determining institutional facts
Introduction

e-Institutions

- An e-Institution is the computational model of an institution through
  - The specification of the institution's norms in (some) suitable formalism(s).
  - The specification of the institution's procedures and protocols

- In the context of MAS they:
  - reduce uncertainty of other agents' behaviour
  - reduce misunderstanding in interaction
  - allows agents to foresee the outcome of an interaction
  - simplify the decision-making (reduce the possible actions)

- Agent behaviour guided by Norms

---

Introduction

Why a Language for Norms?

Laws, regulations

Language for norms (Formal & Computational)

Normative Agents
Norms in deliberation cycle

Electronic Institutions
Norm enforcement mechanisms
State of the Art (I)

State of the Art (II)
Norms from the Agent perspective

- Influence of norms in Agent behaviour
- Possible World semantics
- Norms in the agent interpreter

Norms and Agents (I)
Influence of norms in the BDI deliberation cycle

- How is the world now?
- What if I perform action A?
- Which action do I choose?
- Norms (obligations, permissions...)

Agent

sensors

perception

state

How the world evolves?

What is the effect of actions?

KB

goals

norms

input

actuators

ENVIRONMENT

action

4. Coordination and Social Models
Norms and Agents (II)

- How do norms influence the behaviour of the agent?
  - Agent has no knowledge about norms
  - Norms are built into the agent’s code
  - Norms are built into the plans and protocols the agent uses
  - Norms are explicit elements in the agent’s reasoning
    - Agent may or may not adopt the norms
    - Agent may or may not follow the norms
      - agent follows the norm whenever possible
      - agent violates the norm sometimes
      - agent violates the norm always if possible

4. Coordination

Norms and Agents (III)

- Problems:
  - Norms are more abstract than the procedures
  - Norms do not have operational semantics

Example:

Regulation: “It is forbidden to discriminate potential recipients of an organ based on their age (race, religion,...)”

Formal norm: \( F(\text{discriminate}(x,y,\text{age})) \)

Procedure: does not contain action “discriminate”
Norms and Agents (IV)

- Most of the approaches talk about norms, but a close-up look shows that they are working at completely different levels of abstraction.
- Idea: there are several levels of abstraction involved in a normative system.

---

Norms and Agents (V)
Possible Worlds Semantics
Norms and Agents (V)

Legally accesible worlds

- The concept of legally accessible worlds allows to describe
  - wanted (legal) and unwanted (illegal) behaviour
  - acceptable (safe) and unacceptable (unsafe) states
- **Violations** when agents breaks one or more norms, entering in an illegal (unsafe) state.
- **Sanctions** are actions to make agents become legal (safe) again.
- Sanctions may include the actions to recover the system from a violation

Norms and Agents (VI)

- **Problem**: in this model interpretation of norms is completely done by the agents.
  - How to ensure that two agents that play the same role have similar sound interpretations of the norms that apply to them?
- **Solution**: to fix part of the interpretation in a given context.

- **Idea**: Agents do not have a relation with the WHOLE world but a part → context of an agent.
Norms and Agents (VII)

- A **Context** is a set of worlds with a shared vocabulary and a normative framework.

- Effects on the Normative Dimension
  - The generic norms applied to the world as a whole are called **Abstract Norms**.
  - **Concrete Norms** are interpretations of the abstract norms in a given context.

\[
W \rightarrow C_a \rightarrow C_b \\
AN_w \rightarrow CN_a \rightarrow L_a \rightarrow N_i \rightarrow \text{role}_a
\]
4. Coordination and Social Models

Norms and Agents (IX)

Agent Control Loop Version 7
1. \( B \leftarrow B_0 \)
2. \( I \leftarrow I_0 \)
3. while true do
4.   get next percept \( \rho \)
5.   \( B \leftarrow \text{next}(B_0, \rho) \)
6.   \( D \leftarrow \text{options}(B, I) \)
7.   \( I \leftarrow \text{filter}(B, D, I) \)
8.   \( \pi \leftarrow \text{plan}(B, I) \)
9.   while not \( \text{complete}(B, \pi) \) or \( \text{incomplete}(I, B) \) do
10.     \( \alpha \leftarrow \text{act}(\pi) \)
11.     \( \text{execute}(\alpha) \)
12.     \( \pi \leftarrow \text{tail}(\pi) \)
13.     get next percept \( \rho \)
14.     \( B \leftarrow \text{next}(B, \rho) \)
15.     \( I \leftarrow \text{filter}(B, D, I) \)
16.     if reconsider(\( I, B \)) then
17.       \( D \leftarrow \text{options}(B, I) \)
18.       \( I \leftarrow \text{filter}(B, D, I) \)
19.     end-if
20.     if not sound(\( \pi, I, B \)) then
21.       \( \pi \leftarrow \text{plan}(B, I) \)
22.     end-if
23. end-while
24. end-while

Norm obligations
add actions to the set of options and may define some priorities or precedence

Norm prohibitions
delete actions from the set of options

Norms from the Institutional perspective

- SMART normative model
- AMELI/ISLANDER
- HARMONIA
- OMNI

Multagent Systems Design (MASD)

Knowledge Engineering and Machine Learning Group
UNIVERSITAT POLITÈCNICA DE CATALUNYA
https://kemlg.upc.edu
It is based in the SMART agent specification framework presented by d’Inverno and Luck [8].

- The framework defines concepts such as
  - **objects**,
  - **agents** (which are objects with goals)
  - **autonomous agents** (which are agents with motivations).

- This framework is developed in the Z specification language [9].

The SMART framework has been extended [2][7] to introduce, as part of the framework, representations of

- **norms**
- **normative agent**
- **Normative MAS**

The authors have also presented an architecture for autonomous social and normative agents in order to reason about norms.
**SMART Normative Systems model**

**Norm definition**

```
Norm
  normativegoals : P.Goal
  addressees : P.AgentName
  beneficiaries : P.AgentName
  context : EnvState
  exceptions : EnvState
  rewards : P.Goal
  punishments : P.Goal
  normativegoals ≠ Ø
  addressees ≠ Ø
  context ≠ Ø
  context ∩ exceptions = Ø
  rewards ∩ punishments = Ø
```

**Norm addressees, legislators, defenders and promoters**

- Norms are related not only with the agents that should fulfill it or enforce it, but also with agents such as the one that issued the norm, the one(s) responsible of its enforcement (the **defenders**), the one that modified it or the one(s) that may be affected by a non-compliance of the norm.

```
AuthoritiesNMAS

NormativeMAS
  legislators : P.AgentName
  defenders : P.AgentName
  promoters : P.AgentName

∀ lg : legislators • (∃ norm : legislation norms • lg ∈ norm.addressees)
∀ df : defenders • (∃ norm : enforcement norms • df ∈ norm.addressees)
∀ pm : promoters • (∃ norm : reward norms • pm ∈ norm.addressees)
```
SMART Normative Systems model
Norm Lifecycle

- Norms are not modelled as static constraints but as objects that can have several states (such as *issued, active, modified, fulfilled* or *violated*).
SMART Normative Systems model
Norms and the concept of Power

- They also have analysed in [7] the different power relations that may arise in an agent society,
  - institutional power: social structures define norms that entitle agents to direct the behaviour of others (institutional power)
  - personal power: the power of an agent given by its capabilities to satisfy goals and the power of other agents to benefit or to hinder those goals.
- However,
  - no implementation of the architecture applying it to a real problem has been reported in literature,
  - there are no tools to support the development of a normative multi-agent system following their framework.

AMELI
M. Esteve, J.A. Rodríguez-Aguilar and P. Noriega

- AMELI [3] is an institution middleware that is based in an electronic institution specification (ISLANDER).
- The ISLANDER framework [4] [3] is composed of:
  - A Dialogical Framework
    - Linguistic and social structure (roles) to give meaning to agent interactions,
  - A Performative Structure
    - scenes and relationships between scenes (navigation, precedence, causality)
  - Rules
    - Role-dependent conventions to establish social commitments
- Two hypotheses:
  - All agent actions are messages, observable by the e-institution
  - An Agent should never break the norms.
AMELI
ISLANDER: Performative Structure (I)

Scene conversational graphs: Reception Room

AMELI
ISLANDER: Performative structure (II)
AMELI
Role of the AMELI middleware

- The AMELI middleware aims to:
  - Mediate and facilitate agent communication within conversations (scenes).
  - Coordinate and enforce:
    - to guarantee the correct evolution of each conversation (preventing errors made by the participating agents by filtering erroneous illocutions, thus protecting the institution).
    - To guarantee that agents’ movements between scenes comply with the specification.
    - To control which obligations participating agents acquire and fulfil.
  - Manage information to facilitate participating agents the information they need to participate in the institution.

AMELI
Social Layer

- The current implementation of the social layer is composed of four types of agents:
  - An institution manager that starts the institution, authorises agents to enter, and controls the creation of scenes.
  - Scene managers responsible for governing scenes.
  - Transition managers control agents’ movements between scenes.
  - Governors devoted to mediate the interaction of an agent with the rest of agents within the institution and to control agents’ obligations.
    - Facilitates to the agent some information about the state of the institution.
    - Coordinates with other agents of the social layer for the correct execution of the institution.
    - Keeps track whether the agent pending acquires new obligations and fulfils some of its pending obligations.
AMELI

**4. Coordination and Social Models**

AMELI Limitations

- AMELI comes with a toolkit to help create institutional specifications, create the associated governors and create an e-Institution instance from an ISLANDER specification.

- But:
  - Weak notion of norms (norms only as restrictions, not as preference shapers).
  - Norms are never to be broken → no autonomy
  - Norms are only defined at the action-interaction level → too low-level
  - The only actions that can be controlled are messages
  - Message interactions are defined step by step → no flexibility.
  - Norm handling is done by the Governors, not the agents → agents cannot reason about the norms
  - No mechanism designed for the agents to introduce the norms in their reasoning → designer tends to hard-code them.
HARMONIA
J. Vázquez-Salceda

- Approaches in literature were too theoretical (e.g. SMART) or too practical (e.g. AMELI)
  - There was a gap between the specification of abstract norms and the concrete implementation inside e-Organizations
- HARMONIA [1] is a multi-level framework that proposes a formal connection between the different abstraction levels of a Normative System
  - It distinguishes between normative and practical levels
  - Analysis of Context in Normative Systems
    - *context and norms, nested contexts, super-contexts’ influence*
  - Establishes connection between formal specification and agent implementation
    - top-down: design guidance
    - bottom-up: track the origins of a protocol/plan
  - Norm enforcement as detecting illegal worlds

---

E-INSTITUTION

**ABSTRACT LEVEL**
- STATUTES
  - Values
  - Objectives
  - Context

**CONCRETE LEVEL**
- Concrete Norms

**PROCEDURE LEVEL**
- Rules
- Procedures

**BACKGROUND KNOWLEDGE**
- INST. templates
  - Abstract Norms
  - Rule sets
  - Generic Policies
- • Standards
  • Technologies
  • Algorithms

**CONTEXT**
- Domain Regulations
- Domain Procedures
Abstract Level

- The statutes define the
  - Values
  - Objectives
  - Context
  of the organization.

E.g.: Organización Nacional de Trasplantes:

- The main objective of ONT is to increase the number of organ donations and the subsequent increase in available organs for transplants.
- The ONT operates according to the regulation of the national health system and it strives to distribute the donated organs in the most appropriate and correct way according to the current technical knowledge and according to the ethical principles of equality.

Abstract Level: Abstract Norms (I)

- **Values** are beliefs that we have about what is important and thus about how things should be.
  - "Appropriate distribution"
  - "Distribution according to ethical principles of equality"
  - "Fairness of transaction"
  - "Respect privacy of persons"
- **Values** can be considered as the most abstract level on which norms are expressed.
- The values of an organization can be defined by the set of **Abstract Norms** specified within the org. that contributes to that value:

$$D(\text{equity}) =:= \{ F_{\text{ONT}}(\text{discriminate}(x,y,\text{age})), \ O_{\text{ONT}}(\text{find\_best\_recipient}(\text{organ})), \ \cdots \}$$

$$D(\text{appropriate}(\text{distribution})) =:= \ O_{\text{ONT}}(\text{appropriate}(\text{distribution}))$$
Abstract Level: Abstract Norms (II)

- **Problem:** These norms are too abstract, as they use concepts that are not fully described in the organization’s ontology.
  - “It is forbidden to discriminate based on age”
  - $F_{\text{ONT}}(\text{discriminate}(x,y,\text{age}))$,

Norms can be abstract in the following ways:
- They refer to an abstract action
- They use terms that are vague
- They abstract from temporal aspects
- They abstract from agents and or roles
- They refer to actions or situations that are not (directly) controllable and/or verifiable by the organization

Abstract Level: Abstract Norms (III)

- **example 1:** Abstract actions
  - “a living donor should consent to the donation of an organ”
  - $\text{sign}($donor,contract$) \cup \text{carry}($donor,will$) \cup \text{tell}($donor,family$) \implies_{\text{ONT}} \text{Consent}(\text{donor})$

- **example 2:** Vague terms
  - “the ONT is obliged to ensure that the distribution of organs and tissues is appropriate”
  - $O_{\text{ONT}}(\text{ensure\_quality}(\text{organ})) \land O_{\text{ONT}}(\text{ensure\_compatibility}(\text{organ, recipient})) \implies_{\text{ONT}} O_{\text{ONT}}(\text{appropriate}(\text{distribution}))$
**HARMONIA**  
**Abstract/Concrete Level: Representing Norms**

- Formal representation of norms needed
- Which logic?
  - Abstract and Concrete Norms permit, oblige or prohibit
  - Concrete Norms may be conditional
  - Concrete Norms may have temporal aspects
  - Concrete Norms are relativized to roles

---

**HARMONIA**  
**Concrete Level: Concrete Norms**

- Concrete norms are the result of translating the abstract norms in the context of the organization into norms that make use of terms and actions that are defined in the organization’s ontology.

\[ O_{\text{hosp}}(\text{consent(donor(p,x)))} \prec \text{done(transplant(hosp,x,p,q)))} \]

- **Problem:** HOW is a concrete norm like this implemented in an e-Organization?
**HARMONIA**

**Rule Level (I)**

- Translation from *Normative* dimension to a *Descriptive* one
  - Idea: reduction from *Deontic Logic* to *Dynamic Logic* [J.-J. Meyer]

\[
O_{hosp}(\text{consent(donor(p,x))} < \text{do(transplant(hosp,x,p,q)))} \\
\downarrow \\
[\text{transplant(hosp,x,p,q)}]\text{done(consent(donor))}
\]

\[
O_{buyer}(\text{pay(goods,seller,price)} < \text{do(exit(buyer)))} \\
\downarrow \\
\neg(\text{done(pay(goods,seller,price)))} \rightarrow [\text{exit(buyer)}]V(\text{fine(buyer))}
\]

**Rule Level (II)**

- Rules, Violations and Sanctions
  - Violation rules define violations
  - A *violation* is composed by
    - *pre-conditions*
    - *sanction*
    - *side effects*
  - *Pre-conditions* are used by Police Agents to detect violations.
  - *Sanctions* are used by Flexible Normative Agents to reason about the utility of breaking the related rule.
  - *Side effects* are used by internal agents to recover the system from the violation.
**HARMONIA**

**Procedure Level**

- Idea: the final implementation of the system

- Formally, translation from Dynamic Logic to a Procedural Language:

  \[
  \{P\} a \{Q\} \equiv P \rightarrow [a]Q
  \]

- Example:

  \[
  \begin{align*}
  \text{not}(\text{done}(\text{assign}(o, r))) & \land \text{done}(\text{ensure_appropriateness}(o, r))) \\
  \rightarrow \{\text{assign}(o, r)\} & \text{done}(\text{assign}(o, r))
  \end{align*}
  \]

**Connecting with the Procedure Level**

**ABSTRACT LEVEL**

- 4. Coordination and Social Models

**CONCRETE LEVEL**

- 4. Coordination and Social Models

**RULE LEVEL**

- 4. Coordination and Social Models

**PROCEDURE LEVEL**

- 4. Coordination and Social Models
**HARMONIA**

Procedure Level: Implementing Norms in eInstitutions (I)

- Implementation of norms from institutional perspective
- Implementation of a safe environment
- 2 options depending on control over agents
  - Defining constraints on unwanted behaviour
  - Defining violations and reacting to these violations
- our assumptions:
  - Norms can be sometimes violated by agents
  - The internal state of agents is neither observable nor controllable
    - actions cannot be imposed on an agent's intentions
    - agents as black boxes
    - only their observable behaviour and actions

**HARMONIA**

Procedure Level: Implementing Norms in eInstitutions (II)

- Norm enforcement is not centralized but distributed in a set of agents, the Police Agents
  - They check if a given (observable) action was legal or illegal given the violation conditions defined for that context.
- The Agent Platform should assist the Police Agents, providing fast, very efficient aids for norm enforcement as additional platform services and mechanisms.
- A) Detection of the occurrence of an action
  - Police Agents may become overloaded checking ALL actions
  - **black list mechanism** (of actions to monitor) e.g., *assign*
  - **action alarm mechanism** (alarm to the Police Agent)
  - The Police Agent checks if conditions for a violation apply.
HARMONIA
Procedure Level: Implementing Norms in eInstitutions (III)

- **B) Detection of activation/deactivation of norms**
  - activation = when condition C is true
  - deactivation = when P holds, A is done or C is false
  - reaction time: time allowed between norm activation and reaction
  - Depending on the complexity to check C, the platform should implement the appropriate fast-access data structures and/or processing mechanisms to reduce Police Agents’ computation burden

- **C) Deadline control**
  - a clock trigger mechanism to detect that a deadline has passed

---

HARMONIA
Procedure Level: Example of Norm violation definition

```
Norm FORBIDDEN(allocation DO assign(organ, recipient))
condition IF NOT(hospital DONE ensure quality(organ))
Violation NOT(done(ensure quality(organ)) AND
clock trigger mechanism
Detection {detect alarm(assign, 'starting');
Sanction inform(board, "NOT(done(ensure quality(organ))")
Reps {stop assignation(organ);
record("NOT(done(ensure quality(organ)) AND
done(assign(organ, recipient))", incident.log);
detect alarm(ensure quality, 'done');
check(done(ensure quality(organ)));
resume assignation(organ);}
```
**HARMONIA**
All levels: Roles (I)

- Role definition guided by goal distribution
  - Origin: Objectives in Statutes
- Distribution of responsibilities

---

4. Coordination and Social Models

---

51

---

52
HARMONIA
All levels: Roles (I)
- Role definition guided by goal distribution
  - Origin: Objectives in Statutes
- Distribution of responsibilities

4. Coordination and Social Models

ONT

- Manage organ offers
- Monitor the process

CARREL

- Manage organ offers
- Authenticate agents offering/requesting tissues
- Check the behaviour of agents offering and requesting tissues

Tissue bank

- Manage tissue requests and offers

Hospital

- Request tissues and coordinate tissue transplantation
- Offer tissues
- Coordinate tissue transplantation
- Assign tissues

Surgeon

- Request tissues
- Offer tissues

Police

- Monitor the process

Admission

- Authenticate agents offering/requesting tissues

Data manager

- Manage tissue requests and offers

Allocator

- Assign tissues

Planner

- Build the delivery plan

4. Coordination and Social Models

53
HARMONIA
All levels: Roles (II)

- Role hierarchy extended with power relations to model the distribution of responsibilities not defined in the hierarchy

HARMONIA
All levels: Context (I)

- Statutes make reference to a surrounding context
- Links with the idea of nested contexts
  - $e_{org_x}$ is a context defining a vocabulary and a normative system
  - there are super-contexts that have an influence in $e_{org_x}$ definition
- formal view: influence as interpretation in the subcontext
  - counts-as operator $\bowtie$ as a link between interpretations
- influence in several levels of abstraction
  - vocabulary (terms, predicates)
  - values, norms, rules and procedures
4. Coordination and Social Models

ONT(appropriate(distribution))

CONCRETE LEVEL

ONT(ensure_appropriateness(organ,recipient) < do(assign(organ,recipient)))

CARREL(ensure_appropriateness(organ,recipient) < do(assign(organ,recipient)))

RULE LEVEL

[assign(organ,recipient)] done(ensure_appropriateness(organ,recipient))

PROCEDURE LEVEL

ensure_appropriateness(organ,recipient) assign(organ,recipient)

Spanish National Health System

4. Coordination

57

58
**HARMONIA**

All levels: Background Knowledge

- The Background Knowledge is a repository containing templates that can be adapted to create new e-organizations
  - At the abstract level, it provides a collection of abstract norms and the related ontology and abstract roles
  - At the concrete and rule levels, it provides templates for some generic policies
    - e.g., the security policy
      - concrete norms, rules and ontology
  - At the procedure level it provides a link with the standards, technologies and algorithms needed to implement the policies

- Idea for future: Institutional templates to be parameterized, adapted or implemented to build e-Institutions.

\text{social-contract}(\text{agent1}, \text{PC-member}, \emptyset) \\
\forall \text{scene}: \text{PC-member} \in \text{roles(scene)}, \text{rea}(\text{agent1}, \text{PC-member}, \text{scene})
\]

\[
\text{social-contract}(\text{agent2}, \text{PC-member}, \{\text{maximum to review papers is 3}\}) \\
\forall \text{scene}: \text{PC-member} \in \text{roles(scene)}, \text{rea}(\text{agent2}, \text{PC-member}, \text{scene})
\]

## OMNI
Implementation Level: Interaction Model

- **Scene Instantiation**
  - protocols realizing landmarks
- **Interaction contract**
  - describes a specific performance of a scene

\[
\text{interaction-contract}(\{\text{PC-Chair, pc1, pc2, pc3, pc4}\}, \text{review-process}, \emptyset, P1)
\]

\[
\text{interaction-contract}(\{\text{PC-Chair, pc3, pc5}\}, \text{review-process}, \\
\{\text{IF NOT reviews-done BEFORE DeadlineR THEN PERMITTED(PC-Chair, paper-accepted(P))}\}, P2)
\]
OMNI
Implementation Level: Norm Enforcement

- Based in HARMONIA
- New idea: OperA’s Landmarks to monitor norm execution
  - Landmark as observable system state
