Assignment

Write a python program that parses all XML files in the folder given as argument and recognizes and classifies sentences stating drug-drug interactions. The program must use a neural network approach.

```
$ python3 ./nn-DDI.py data/Devel/  
DDI-DrugBank.d398.s0|DDI-DrugBank.d398.s0.e0|DDI-DrugBank.d398.s0.e1|effect  
DDI-DrugBank.d398.s0|DDI-DrugBank.d398.s0.e0|DDI-DrugBank.d398.s0.e2|effect  
DDI-DrugBank.d211.s2|DDI-DrugBank.d211.s2.e0|DDI-DrugBank.d211.s2.e5|mechanism  
...
```

General Structure

The general structure is basically the same than for the traditional ML approach:

- Two programs: one learner and one classifier.
- The learner loads the training (Train) and validation (Devel) data, formats/encodes it appropriately, and feeds it to the model, together with the ground truth.
- The classifier loads the test data, formats/encodes it in the same way that was used in training, and feeds it to the model to get a prediction.

In the case of NN, we don't need to extract features (though we **do need** some encoding)

Input Encoding

- The input/output layers of a NN are vectors of neurons, each set to 0/1.
- Modern deep learning libraries handle this in the form of *indexes* (i.e. just provided the *position* of active neurons, omitting zeros).
- For instance, in a LSTM, each input word in the sequence may be encoded as the concatenation of different vectors each containing information about some aspect of the word (form, lemma, PoS, suffix...)
- Each vector will have only one active neuron, indicated by its *index*. This input is usually fed to an embedding layer.
- Our learned will need to create and store *index* dictionaries to be able to interpret the model later. See class *Codemaps* below.

Learner - Main program

```
1 def learn(traindir, validationdir, modelname) :
2     '''
3     learns a NN model using traindir as training data, and validationdir
4     as validation data. Saves learnt model in a file named modelname
5     '''
6
7     # load train and validation data
8     traindata = Dataset(trainfile)
9     valdata = Dataset(validationfile)
10
11    # create indexes from training data
12    max_len = 150
13    suf_len = 5
14    codes = Codemaps(traindata, max_len, suf_len)
15
16    # build network
17    model = build_network(codes)
18    with redirect_stdout(sys.stderr) :
19        model.summary()
20
21    # encode datasets
22    Xt = codes.encode_words(traindata)
23    Yt = codes.encode_labels(traindata)
24    Xv = codes.encode_words(valdata)
25    Yv = codes.encode_labels(valdata)
26
27    # train model
28    with redirect_stdout(sys.stderr) :
29        model.fit(Xt, Yt, batch_size=32, epochs=10, validation_data=(Xv,Yv),
30                verbose=1)
31
32    # save model
```

Classifier - Main program

```
1 def predict(modelname, datadir, outfile) :
2     '''
3     Loads a NN model from file 'modelname' and uses it to extract drugs
4     in datadir. Saves results to 'outfile' in the appropriate format.
5     '''
6
7     # load model and associated encoding data
8     model = load_model(fname)
9     codes = Codemaps(fname)
10
11    # load and encode data to annotate
12    testdata = Dataset(datafile)
13    X = codes.encode_words(testdata)
14
15    # tag sentences in dataset
16    Y = model.predict(X)
17    Y = [codes.idx2label(np.argmax(s)) for s in Y]
18
19    # extract relations
20    output_interactions(testdata, Y, outfile)
```

Note: Observe the output structure (one class per sentence+pair), different from the NER task (one class per token).

Auxiliary classes - Dataset

```
1 class Dataset:
2     ## constructor:
3     ## If 'filename' is a directory, parses all XML files in datadir,
4     ## tokenizes
5     ## each sentence, and stores a list of sentence/pairs, each
6     ## of them as a parsed tree with masked target entities
7     ## tokens (word, start, end, gold_label), plus associate ground truth.
8     ## If 'filename' is a '.pck' file, load data set pickle file
9     def __init__(self, filename)
10
11     ## saves dataset to a pickle file (to avoid repeating parsing)
12     def save(self, filename)
13
14     ## iterator to get sentences in the dataset
15     def sentence(self)
16     '''
```

Class Dataset will *mask* the target entities in the input sentence:

Original sentence: *Exposure to oral ketamine is unaffected by itraconazole compounds but greatly increased by ticlopidine.*

Pair Masked sentence

e0-e1 Exposure to oral DRUG1 is unaffected by DRUG2 but greatly increased by DRUG_OTHER.

e0-e2 Exposure to oral DRUG1 is unaffected by DRUG_OTHER but greatly increased by DRUG2.

e1-e2 Exposure to oral DRUG_OTHER is unaffected by DRUG1 but greatly increased by DRUG2.

Auxiliary classes - Codemaps

```
1 class Codemaps :
2     # Constructor: create code mapper either from training data, or
3     # loading codemaps from given file.
4     # If 'data' is a Dataset, and lengths are not None,
5     # create maps from given data.
6     # If data is a string (file name), load maps from file.
7     def __init__(self, data, maxlen=None, suflen=None)
8     # Save created codemaps in file named 'name'
9     def save(self, name)
10    # Convert a Dataset into lists of word codes and suffix codes
11    # Adds padding and unknown word codes.
12    def encode_words(self, data)
13    # Convert the gold labels in given Dataset into a list of label codes.
14    # Adds padding
15    def encode_labels(self, data)
16    # get word index size
17    def get_n_words(self)
18    # get suf index size
19    def get_n_sufs(self)
20    # get label index size
21    def get_n_labels(self)
22    # get index for given word
23    def word2idx(self, w)
24    # get index for given suffix
25    def suff2idx(self, s)
26    # get index for given label
27    def label2idx(self, l)
28    # get label name for given index
29    def idx2label(self, i)
```

Required functions - build_network

```
1 def build_network(codes) :
2
3     # sizes
4     n_words = codes.get_n_words()
5     max_len = codes.maxlen
6     n_labels = codes.get_n_labels()
7
8     # word input layer & embeddings
9     inptW = Input(shape=(max_len,))
10    embW = Embedding(input_dim=n_words, output_dim=100,
11                    input_length=max_len, mask_zero=False)(inptW)
12
13    conv = Conv1D(filters=30, kernel_size=2, strides=1, activation='relu',
14                 padding='same')(embW)
15    flat = Flatten()(conv)
16
17    out = Dense(n_labels, activation='softmax')(flat)
18
19    model = Model(inptW, out)
20    model.compile(loss='categorical_crossentropy', optimizer='adam', metrics
21                 =['accuracy'])
22
23    return model
```

Structure

Detailed
Structure

Auxiliary classes

Core task

Goals &
Deliverables

Required functions - `build_network`

- DDI is **not** a sequence tagging task (which assign one label per word), but a sentence classification, where a single label is assigned to the whole sentence (or sentence + entity pair in this case).
- The problem may be approached with an LSTM, but instead of getting the output at each word (`return_sequences=True`), only the output at the end of the sequence must be used.
- Using a CNN instead also produces good results for text processing. It is also possible to combine LSTM and CNN layers.
- You will need to add one Embedding layer after the input, that is where the created indexes will become handy.
- You get inspiration for an architecture from these examples: [1], [2],[3],[4], some of the papers provided in labAHLT package in `papers/SharedTask/otherSystems`, or just googling for *several DDI neural networks*.

Build a good NN-based DDI detector

Strategy: Experiment with different NN architectures and possibilities.

Some elements you can play with:

- Embedding dimension
- Number and kind of layers
- Using just CNN, just a LSTM, or a LSTM+CNN combination
- Use transformer attention blocks
- Using lowercased and/or non lowercased word embeddings
- Initializing embeddings with available pretrained model
- Using extra input (e.g. lemma embeddings, PoS embeddings, suffix/prefix embeddings, ...)
- Adding extra dense layers, with different activation functions
- Using pretrained transformers such as Bert as the first layers of your network.
- ...

Neural
Networks DDI

General
Structure

Detailed
Structure

Core task

Goals &
Deliverables

Build a good NN-based DDI detector

Warnings:

- Neural Network training uses randomization, so different runs of the same program will produce different results. For repeatable results, use a random seed.
- During training, Keras reports accuracy on training set and on validation set. Those values are usually over 85%. However, this is due to the fact that about 85% of the pairs have interaction “null” (no-interaction). Thus, 85% accuracies correspond very low F_1 values. To get a reasonable F_1 , val_accuracy must reach about ~88-90%.

To precisely evaluate how your model is doing, do not rely on reported accuracy: run the classifier on the Development set and use the evaluator.

Exercise Goals

What you should do:

- Work on your architecture and input vectors. It is the component of the process where you have most control.
- Experiment with different architectures and hyperparameters.
- Experiment with different input information
- Keep track of tried variants and parameter combinations.

What you should **NOT** do:

- Alter the suggested code structure.
- Produce an overfitted model: If performance on the test dataset is much lower than on devel dataset, you probably are overfitting your model. Note that a very large/deep NN applied to a reduced dataset (as is this case) will just *remember* the training data and thus will not generalize properly.

Neural
Networks DDI

General
Structure

Detailed
Structure

Core task

Goals &
Deliverables

Exercise Goals

Oriental results:

- Provided CNN architecture gets a macroaverage F1 over 50%. Input information includes only embeddings for word forms.
- The NN may be extended with extra input information, additional convolutional layers (either separate for each input or after concatenating them), changing their size, changing the size/stride of the convolutional kernel, adding LSTM layers (before the CNN, after it, or instead of it), maxpool layers (typically after the CNN or LSTM), etc.
- Goal: achieve ~65% macro average F1.

Neural
Networks DDI

General
Structure

Detailed
Structure

Core task

Goals &
Deliverables

Deliverables

Write a report describing the work carried out in both NN exercises
The report must be a **single self-contained PDF document**, under ~10 pages, containing:

- *Introduction*: What is this report about. What is the goal of the presented work.
- *NN-based NERC*
 - *Architecture*: What architectures did you try, and which was finally selected.
 - *Input information*: What input data did you use, and how did you encode it to feed the NN.
 - *Code*: Include your `build_network` function (and **any other function** it may call), properly formatted and commented. **Do not include any other code.**
 - *Experiments and results*: Results obtained on the **devel** and **test** datasets, for different architecture/hyperparameter combinations you deem relevant.
